You can check the latest updated version of this article at [lobotuerto's notes - How to install Node.js in Manjaro Linux](https://lobotuerto.com/notes/how-to-install-nodejs-in-manjaro-linux).

Installation process

Version managers rule in dev environments.

So we will install [Node.js](#) through [nvm](#).

Install the `nvm` package from the [AUR](#):

```
pacaur -S nvm
```

Then on your terminal:

```
echo 'source /usr/share/nvm/init-nvm.sh' >> ~/.bashrc  
exec $SHELL
```

To list all available versions for **Node.js** :

```
nvm ls-remote
```

Let's install latest from the **9** series:

```
nvm install 9  
node -v #v9.8.0  
npm -v #5.6.0
```

Add the **Yarn** package manager globally:

```
npm install -g yarn
```

We need to add **Yarn's** binary to our `$PATH` in `~/.bashrc` .

In a terminal:

```
echo 'export PATH=$PATH:~/.yarn/bin' >> ~/.bashrc
```

If you are a [Vue.js](#) fan —and why shouldn't you be one? :)—
install [vue-cli](#):

```
yarn global add vue-cli
```
